

Missouri cattle have a real nose for distillers grains.

Missouri livestock producers large and small have developed a real appetite for feeding distillers grains to their animals.

Distillers grains, an ethanol co-product, is a high-value livestock feed that provides cost-efficient energy, protein and phosphorus. When used as a supplement, distillers grains can have substantial positive effects on rate of gain, feed efficiency and profitability.

With Missouri's farmer-owned ethanol industry, Missouri beef and dairy producers now have this valuable feed in their own backyard. So we're not only making fuel from Missouri corn. We're also making livestock feed for animals that produce nutritious food for us all.

These ethanol co-products are gaining popularity in cattle rations across Missouri. Because when it comes to nutrient value, efficiency and palatability, they simply can't be licked.
